Seal Shield Adds Air Treatment From Airocide, A NASA-Developed Technology, to Product Line

Healthcare company to demonstrate Airocide® air treatment technology at APIC booth #217.

Jacksonville, FL (June 6, 2013) - Seal Shield LLC today announced it has extended their product line beyond waterproof or antimicrobial product protection electronics to now include air treatment technology from Airocide®. Similar to surface contamination, airborne contamination poses a threat to patient safety. Airocide technology, developed by NASA, converts damaging molds, microorganisms, viruses, bacteria, destructive VOCs and biological gasses into harmless water vapor without producing Ozone or other harmful by-products. Green and energy efficient, treated air exits as 99.999% pathogen free on the first pass.

According to UK infection control expert Diane Gilmour, "MRSA may also be released into the atmosphere on skin squames and fibers from clothing and carried as dust particles." This supports other research findings that there is a significant relationship between airborne colonization and nosocomial infections.

"Airborne contaminants pose a threat to patient safety and our healthcare customers are seeking solutions for all cross-contamination points in the healthcare environment," states Seal Shield CEO and Chairman, Bradley Whitchurch. "Airocide has shown meaningful reductions in viruses and bacteria, and offers unparalleled air treatment with its patented NASA-developed technology," concluded Whitchurch.

In the past, Seal Shield's focus has been primarily on washable keyboards and mice with antimicrobial product protection. More recently, the company has expanded its product line to include infection control products for mobile devices with the same innovative technology. The addition of Airocide's air treatment technology fits with the company's strategy to create and offer the most complete infection control solutions available.

Seal Shield designs, develops and manufactures medical grade, infection prevention technology for hospitals and the home, including waterproof keyboards, mice and TV remotes. Seal Shield is a world leader in infection control technology, specializing in washable electronics and antimicrobial science. For more information please visit <http://www.SealShield.com/>
